Original publisher: Cleveland, Ohio : National Aeronautics and Space Administration, Glenn Research Center ; Hanover, MD : Available from NASA Center for Aerospace Information, 2002 OCLC Number: (OCoLC)55975012 Excerpt: . . . where is a parameter associated with elastic modulus, hardness, indent crack geometry and fracture resistance. The parameter represents the degree of fracture resistance (R-curve) as defined in 22 K c (3) R K c where is fracture resistance, is the crack size, and is a parameter. Equation 2 is a common R expression of rising R-curve behavior for ceramic materials. When 0, the case reduces to a flat-1 3 P K K R-curve such that and . R-curve behavior of a brittle material can be if R IC estimated based on Equation (3) by determining the parameter from (the slope of) the indent vs strength. indent load data (such as Figure 9) and then using this value to determine the parameter using a known value of fracture toughness (obtained by, for example, SEPB) c evaluated with the particular precrack size () used. The resulting R-curve behavior thus estimated for AS800 and SN282 is shown in Figure 10. The previously determined R-curve of NC132 silicon nitride 15 is also included in the figure. AS800 exhibits not only greater fracture toughness but also stronger R-curve behavior than SN282, while the conventional, equiaxed fine-grained NC132 silicon nitride typically exhibits a flat R-curve and low fracture toughness. Analytical Considerations on Strength Degradation A phenomenological model of strength degradation due to ball impact was proposed previously by Wiederhorn and Lawn 1 , based on assumptions that the impact event was elastic and quasi-static and that strength...
